

63. Given an integer array `nums` and an integer `val`, remove all occurrences of `val` in `nums` in-place. The relative order of the elements may be changed.

Since it is impossible to change the length of the array in some languages, you must instead have the result be placed in the first part of the array `nums`. More formally, if there are `k` elements after removing the duplicates, then the first `k` elements of `nums` should hold the final result. It does not matter what you leave beyond the first `k` elements.

Return `k` after placing the final result in the first `k` slots of `nums`.

AIM: To Remove all occurrences of value.

PROGRAM:

```
def removeElement(nums, val):
```

```
    if not nums:
```

```
        return 0
```

```
    i = 0
```

```
    for j in range(len(nums)):
```

```
        if nums[j] != val:
```

```
            nums[i] = nums[j]
```

```
            i += 1
```

```
    return i
```

```
nums1 = [3, 2, 2, 3]
```

```
val1 = 3
```

```
print(removeElement(nums1, val1))
```

```
print(nums1)
```

```
2
```

```
[2, 2, 2, 3]
```

OUTPUT:

TIME COMPLEXITY: $O(n)$
